The goal of conserving biological diversity is to ensure that variability and variation will continue to be present and can dynamically develop and evolve both through natural processes and through the direct or indirect intervention or influence of humans (Eriksson et al. 1993; FAO 1989; FAO 2001c). The values derived from biological diversity are associated with different scales.

Founded in 1992, Biodiversity and Conservation is an international journal that publishes articles on all aspects of biological diversity, its conservation, and sustainable use. It is multidisciplinary and covers living organisms of all kinds in any habitat, focusing on studies using novel or little-used approaches, and ones from less studied biodiversity rich regions or habitats.

Reinforcement is a process of speciation where natural selection increases the reproductive isolation (further divided to pre-zygotic isolation and post-zygotic isolation) between two populations of species.This occurs as a result of selection acting against the production of hybrid individuals of low fitness.The idea was originally developed by Alfred Russel Wallace and is sometimes referred ...

The conservation efforts of the last decades have made a significant difference in the state of biodiversity today. Over 100,000 protected areas—including national parks, wildlife refuges, game reserves, and marine protected areas, managed both by governments and local communities—provide habitat for wildlife, and help keep deforestation in check.

Conservation biology and the concept of biological diversity (biodiversity) emerged together, helping crystallize the modern era of conservation science and policy. The inherent multidisciplinary basis for conservation biology has led to new subdisciplines including conservation social science, conservation behavior and conservation physiology.

Reintroduction of Fish and Wildlife Populations

provides a practical step-by-step guide to successfully planning, implementing, and evaluating the reestablishment of animal populations in former habitats or their introduction in new environments. In each chapter, experts in reintroduction biology outline a comprehensive synthesis of core concepts, issues, techniques, and perspectives. This manual and reference supports scientists and managers from fisheries and wildlife professions as they plan reintroductions, initiate releases of individuals, and manage restored populations over time. Covering a broad range of taxonomic groups, ecosystems, and global regions, this edited volume is an essential guide for academics, students, and professionals in natural resource management.

Biodiversity studied by researching island species recovery and management.

Resource-management decisions, especially in the area of protecting and maintaining biodiversity, are usually incremental, limited in time by the ability to forecast conditions and human needs, and the result of tradeoffs between conservation and other management goals. The individual decisions may not have a major effect but can have a cumulative major effect. Perspectives on Biodiversity reviews current understanding of the value of biodiversity and the methods that are useful in assessing that value in particular circumstances. It recommends and details a list of components-including diversity of species, genetic variability within and among species, distribution of species across the ecosystem, the aesthetic satisfaction derived from diversity, and the duty to preserve and protect biodiversity. The book also recommends that more information about the role of biodiversity in sustaining natural resources be gathered and summarized in ways useful to managers. Acknowledging that decisions about biodiversity are necessarily qualitative and change over time because of the nonmarket nature of so many of the values, the committee recommends periodic reviews of management decisions.

The publication was prepared based on information provided by 86 countries, outcomes from regional and subregional consultations and commissioned thematic studies. It includes: • an overview of definitions and concepts related to Forest Genetic Resources (FGR) and a review of their value; • a description of the main drivers of changes; • the presentation of key emerging technologies; • an analysis of the current status of FGR conservation, use and related developments; • recommendations addressing the challenges and needs. By the FAO Commission on Genetic Resources for Food and Agriculture.
