Fig. 17. Amphioxus Fig. 18 All vertebrates

The Phylum Chordata consists of both invertebrate and vertebrate organisms. It is a large and diverse phylum. It includes more of 60,000 species. Chordates range in length from about a centimeter to over 30 meters (100 feet). They live in marine, freshwater, terrestrial from the equator to the poles. The chordate group has four key characteristics: a ...

no Nervous system present Segmentation no 9 Phylum Chordata ...

1. Bony skeleton 2. Lateral line system 3. Swim bladder to help control depth 4. Lay eggs (Oviparous) 5. Have operculum over gills (to protect gills) Ex: perch, bass, flounder. Groups of Bony Fish. • Lung fish (only live in FW) -Can supplement gill breathing with air bladder "lungs" -Can lie dormant in mud for up to 10 years, breathing air.

BIO 342 Comparative Vertebrate Anatomy - Review Questions ...

Vertebrata is subphylum of chordates which can be further defined by characteristics such as bony backbone. They also belong to the kingdom animalia. However, animals with bilateral symmetry are grouped into two, which are protostomes and deuterostomes. The grouping is also based on their pattern of embryonic development.

How are chordates and vertebrates related? - Brainly.com

Both chordates and vertebrates are deuterostomes. Both chordates and vertebrates are bilaterally symmetric coelomates. Both chordates and vertebrates consist of a notochord, nerve cord, pharyngeal gill slits, and a post-anal tail. Both chordates and vertebrates consist of a central nervous system.

Solved: Lancelets And Hagfish Are Both Vertebrates. Common ...

The vertebrates comprise a large group of chordates, and are subdivided into seven classes (3 classes of fish, amphibians, reptiles, birds, and mammals). Vertebrates have an internal skeleton of cartilage or bone, with vertebrae surrounding the dorsal nerve cord. Subphylum Vertebrata. The subphylum Vertebrata consists of about 43,700 species of animals with backbones.

Vertebrate Unit Articles - BIOLOGY JUNCTION

The bony fish have three pairs of arches, cartilaginous fish have five to seven pairs, while the primitive jawless fish have seven. The vertebrate ancestor no doubt had more arches than this, as some of their chordate relatives have more than 50 pairs of gills.
