The need for optimization tools is indispensable in power system operation and planning in the presence of RESs. This is because of the increased variability and uncertainty introduced to the electric system as a result of integrating variable energy sources [44]. In addition, the demand variability over time and the uncertainty related to unexpected interruptions of generators (or other system components) all suggest the need for efficient optimization tools.

Traditional Practices in Power System Planning Traditional electric power systems are designed on the premise of power production in central generating stations and its delivery to the points of end use via transmission and distribution systems. The role of generating stations is clear—they produce electric power or, more precisely, convert energy from another source into electric energy. The roles of transmission and distribution systems are more interrelated; both are concerned with ...

Electric Power System Planning: Issues, Algorithms and ...

An electric power system is a network of electrical components deployed to supply, transfer, and use electric power. An example of a power system is the electrical grid that provides power to homes and industry within an extended area. The electrical grid can be broadly divided into the generators that supply the power, the transmission system that carries the power from the generating centres to the load centres, and the distribution system that feeds the power to nearby homes and industries.
