Fermentation is a metabolic process that produces chemical changes in organic substrates through the action of enzymes.In biochemistry, it is narrowly defined as the extraction of energy from carbohydrates in the absence of oxygen. In food production, it may more broadly refer to any process in which the activity of microorganisms brings about a desirable change to a foodstuff or beverage.

Fermentation - Wikipedia

The uses of fermentation are applied in various sectors such as in pharmaceuticals, brewing, baking, and dairy industry. Fermentation also gives us a health benefit as it benefits our digestive system through nutritious fermented foods. Fermentation is the process by which microbes convert carbohydrates to ethanol and lactic acids. Applications of fermentation were started from ancient times.
