Troubleshooting The Variable Transformer Universal

There should be no open circuit on the secondary side of the current transformer in operation. Once the open circuit occurs on the secondary side, high temperature caused by excessive iron loss may burn out the current transformer or enhance the voltage of secondary winding, thus breaking down the insulation and leading to the danger of high voltage electric shock.

Check the transformer's output voltage. Connect the transformer's primary to a 110-volt source using the Test Jumper. Be careful that the Alligator clips don't touch one another or touch some grounded surface. Do not touch the clips or the primary terminals once the cord is plugged in, as you could receive a fatal shock.

Check both windings. Many transformers have a fuse on the 24 volt side. If the fuse is open, the ohmmeter will read no continuity. There is a probably a short in the 24 volt circuit. Replacement of the transformer will not solve the problem. The new transformer will also fail. I recommend using a transformer without a built in fuse.

Troubleshooting The Variable Transformer Universal

1. Inspect the transformer visually. Overheating, which causes the internal wiring of the transformer to run at elevated temperatures, is a common cause of transformer failure. This often causes a physical deforming of the transformer or the area surrounding it.

How to Test a Transformer: 12 Steps (with Pictures) - wikiHow

The output transformer may be either mounted on the speaker itself, or on the receiver chassis. If the output transformer becomes defective and must be replaced and an exact replacement is not available, a universal type may be used. The universal type has multiple taps on the primary and secondary windings so it may be matched to the circuit.

Test the transformer's output voltage with the multimeter. Compare the reading to the stated output voltage. If the output voltage has a correct reading, the transformer works properly. If the input voltage has a correct reading, but the output voltage has a high or low reading, the secondary windings have a fault.
